

# Volunteers needed for a research study on sleep

We are looking for volunteers who have **mild cognitive impairment** or **dementia** due to **Alzheimer's Disease** to take part in a study to see if a dopamine containing medication might deepen sleep and slow down disease progress.

## What is involved?

- The study involves one visit to the Bristol Brain Centre to check the study is suitable and safe
- You would then be asked to take a dopamine containing medication before bedtime on one occasion and a 'dummy' or 'placebo' medication on another occasion.
- Each time you then go to sleep as normal at home and we measure sleep with a headband that records brain activity.
- There are some memory tasks before and afterwards

Please contact the research team if you are interested in taking part mentioning the **DOPAMIND STUDY**
